

07 Wrap-up

Testing React Apps

How much of each type of test to do?

Tradeoffs

- End-to-End Tests: give confidence the whole app works
- Unit and Component Tests: faster, easier testing of edge cases, influence design of code

My Recommendations

- End-to-end test main flows only
- Component test edge cases
- Extract plain functions and classes when it makes sense, and unit test them
- Tweak as you go

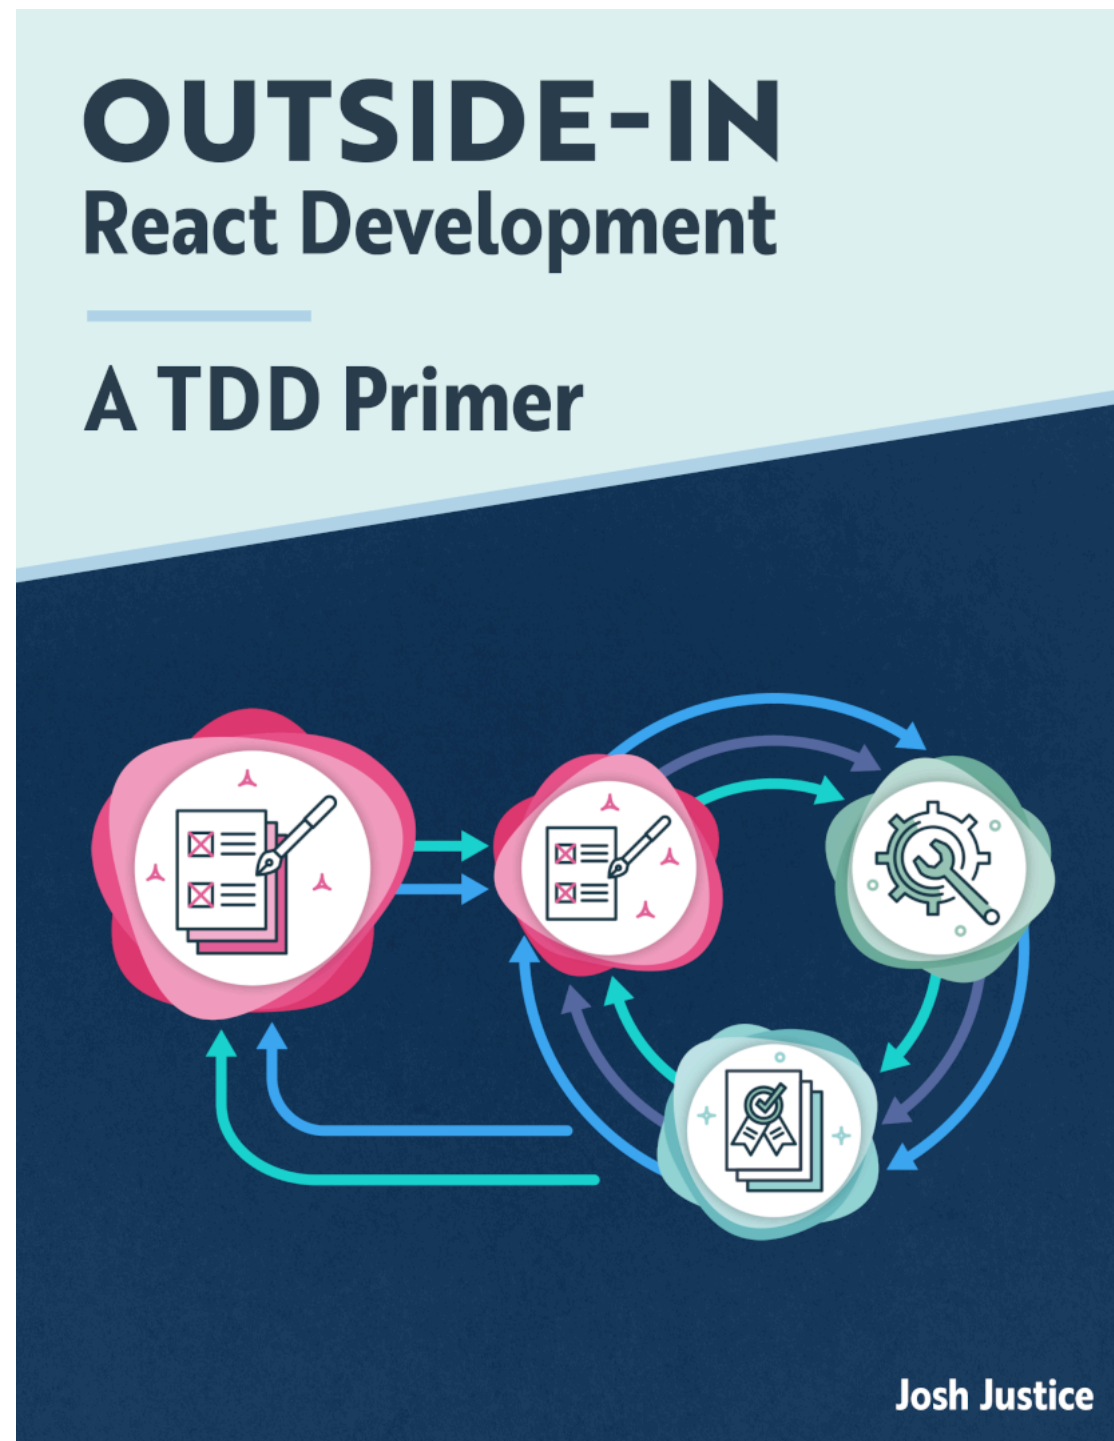

To Discuss

Based on what you learned today, what *specifically* do you want to do differently testing your React app going forward?
